(4300 mwe)
LZ in LUX Water Tank

LUX to be removed by early 2017
Water tank kept
Scale Up $\approx 50$ in Fiducial Mass

**LZ**
- Total mass - 10 T
- WIMP Active Mass - 7 T
- WIMP Fiducial Mass - 5.6 T
LZ Overview

- Instrumentation conduits
- Water tank
- Gadolinium-loaded liquid scintillator veto
- Liquid xenon heat exchanger
- High voltage feedthrough
- 120 veto PMTs
- 7 tonne liquid xenon time-projection chamber
- 488 photomultiplier tubes (PMTs)
- Additional 180 xenon “skin” PMTs
Xe Detector

247 PMT

180 total Skin PMT

241 PMT
Xe Detector PMTs

✦ R11410-22 3” PMTs for TPC region
  □ Extensive development program, 50 tubes in hand, benefit from similar development for XENON1T, PANDA-X and RED
  □ Materials ordered and radioassays started prior to fabrication.
  □ First production tubes early 2016.
  □ Joint US and UK effort

✦ R8520-406 1” for skin region
Testing for cathode HV at Yale moving to LBNL and Berkeley. Also development at IC London.

✦ Cathode voltage Design goal: 200 kV
✦ LZ nominal operating goal: 100 kV (750 V/cm)
✦ Feedthrough prototype tested to 200 kV (Dielectric Sciences 2077)
Cryostat Vessels

- UK responsibility
- Low background titanium chosen
- Ti slab for all vessels (and other parts) received and has been assayed
- Contributes < 0.05 NR+ER counts in fiducial volume in 1,000 days after cuts
85Kr Removal and Screening

- Remove Kr to <15 ppq (10^{-15} g/g) using gas chromatography.
- Best LUX batch 200 ppq
- Setting up to process 200 kg/day at SLAC
- Have a sampling program to instantly assay the removal at SLAC and continuously assay in situ
LZ Calibrations

- Demonstrated in LUX. Calibrate The Signal and Background Model *in situ*.
  - DD Neutron Generator (Nuclear Recoils)
  - Tritiated Methane (Electron Recoils)

Tritium Beta Spectrum Measured in LUX
Background Modeled

Just LXe TPC

Use LXe skin, Outer Det.

Fid. Mass 3.8 T

Fid. Mass 5.6 T

2.2 bkg events, 1,000 days
Projected Sensitivity - Spin Independent

(LZ 5.6 Tonnes, 1000 live days)

- Excellent projected sensitivity limited by neutrinos only.

\[ 2 \times 10^{-48} \text{ cm}^2 \]
Other Physics...

- Axions
- Effective Field Theory Interaction Decomposition
- Neutrinoless Double Beta Decay
  - \(~600\, \text{kg of } ^{136}\text{Xe} \text{ in active volume}\)
  - \(2-5 \times 10^{26}\) year half life
- Neutrino Physics
  - Coherent neutrino-nucleus scattering
  - Solar
  - Supernova
Coherent $\nu$-nucleus Scattering

- LZ may be the first to observe coherent neutrino-nucleus scattering
- $^8$B Recoils mimic low mass WIMPs
- WIMP Search 3-30 keV
- Expect $\sim$10 $^8$B events and 0.5 events from others

- DSN and atmospheric neutrinos will become the dominant background for experiments beyond LZ.
ν-electron Scattering
- The dominant background

With 99.5% electron recoil rejection (at 50% nuclear recoil acceptance)

✦ Wimp Search 1.5-6.5 keVee (and before 99.5% electron recoil rejection)
  ✦ ~270 PP solar events
  ✦ ~40 2νBB

✦ Improve measured solar neutrino luminosity to <5% from 10%

Electron recoils from $^{85}$Kr, $^{222}$Rn and PMTS are less than 10% of PP solar neutrino rate.
Conclusions

✦ LZ Project well underway, with procurement of Xenon, PMTs and cryostat vessels started along with prototype and assay programs

✦ LZ benefits from the excellent LUX calibration techniques and understanding of background

✦ LZ sensitivity expected to be finally limited by neutrino-induced `background’
Xe Detector Prototyping

- Extensive program of prototype development underway
- Three general approaches
  - Testing in liquid argon, primarily of HV elements, at Yale and soon at LBNL
  - Design choice and validation in small (few kg) LXe test chambers in many locations: LLNL, Yale-> UC Berkeley, LBNL, U Michigan, UC Davis, MEPhI
  - System test platform at SLAC. Phase I about 100 kg of LXe starting soon with complete prototype TPC
Design Status Summary

- Conceptual, and in some cases more advanced design, completed for all aspects of detector
- Conceptual Design Report to appear on arXiv
- Acquisition of Xenon started
- Procurement of PMTs and cryostat started
- Collaboration - wide prototype program underway to validate design
- Backgrounds modeling and validation well underway
Tritiated-Methane, The Ideal ER Calibration Source

- Methane diffuses much slower than bare tritium.
- Dissolved uniformly in the xenon.
- Removed with standard purification technology.
- Used to calibrate the fiducial volume.

- Single Scatter ER events in energy region of interest: 0.1 keV to 18 keV
- Mean energy: 5 keV
- Peak energy: 2.5 keV
Adelphi DD108 Neutron Generator Installed Outside LUX Water Tank

- This cut eliminates shine from passive materials and ensures 95% of neutrons in beam sample have energy within 4% of 2.45 MeV.
- The mean energy of neutrons produced at 90° by the DD108 was measured to be 2.45 ± 0.05 MeV at Brown University.
LZ Underground at SURF

Years of experience at SURF from LUX

- Control room
- LN storage room
- LZ detector inside water tank
- Xenon storage room
Sensitivity with SUSY Theories
Sensitivity with Competition
Response of Xe to Neutrinos

arXiv: 1307:5458
LZ - At the neutrino `knee' [arXiv: 1408.3581]

After LZ, extremely large detectors would be needed.
Monitoring $^{85}$Kr background in LUX xenon

- Measure $^{84}$Kr and to infer $^{nat}$Kr/Xe
- Assume atmospheric abundance: $^{85}$Kr/$^{nat}$Kr ratio: $2 \times 10^{-11}$
- Background goal: < 5 ppt Kr/Xe
- By the time $^{85}$Kr decays show up in data analysis... It’s too late!
  *Set Xenon100 back a year* 
  * (1 liter of air is all it takes)
